Mozaic 3+ is a software platform that enables a server, composed of multiple sockets connected by xGMI, to be split into multiple smaller servers. Each of these smaller servers has its own dedicated CPU sockets, memory, and PCIe devices. Mozaic 3+ is designed to be easy to deploy and manage, and to provide performance, reliability, and security comparable to running multiple separate servers.

Mozaic 3+ is the successor to Mozaic 3, which was a research project that showed the feasibility of splitting a server in this way. Mozaic 3+ is a complete rewrite of Mozaic 3, with a focus on ease of deployment, performance, reliability, and security.

Mozaic 3+ is also based on the AMD Infinity Fabric™ architecture, which is the foundation of AMD's EPYC™ processors. Mozaic 3+ is designed to work with the 3rd Gen EPYC processors (codenamed "Milan"), but it is also compatible with the 1st Gen EPYC processors (codenamed "Naples") and the 2nd Gen EPYC processors (codenamed "Rome").

Why Does Server Density Matter to Enterprises?

The trend in recent years has been to pack more and more CPU cores into a single server. Modern servers can contain 128 CPU cores or more, and many business-critical tasks fail to scale beyond the number of CPU cores that can be packed into a single server.

This leads to data centers filled with servers that are underutilized, because the workloads running on them are not able to take advantage of all of the CPU cores. This is inefficient, because it requires more servers to be purchased, and more power and cooling to be provided, than would be necessary if the servers were more highly utilized.

Mozaic 3+ is designed to solve this problem by making it easy to take a single, modern server and split it into multiple smaller servers. Each of these smaller servers has its own dedicated CPU sockets, memory, and PCIe devices. Mozaic 3+ is designed to be easy to deploy and manage, and to provide performance, reliability, and security comparable to running multiple separate servers.

The Benefits of Mozaic 3+ To Cloud and Enterprise Data Centers

Zero TCO of Ownership

Mozaic 3+ is designed to be easy to deploy and manage. Mozaic 3+ automatically configures the server and the xGMI fabric, so that the server is ready to use as soon as it is powered on. Mozaic 3+ also provides a simple command-line interface for managing the server, and a web-based interface for monitoring the server.

Mozaic 3+ is also designed to be reliable and secure. Mozaic 3+ uses the AMD Secure Processor to verify the integrity of the firmware and software that is running on the server. Mozaic 3+ also uses the AMD Secure Memory Encryption (SME) and Secure Encrypted Virtualization (SEV) features to protect the data that is stored in memory.

Mozaic 3+ is designed to be easy to deploy and manage, and to provide performance, reliability, and security comparable to running multiple separate servers. Mozaic 3+ is also designed to be flexible, so that it can be used in a variety of different environments.

Easy Scaling and Flexibility

Mozaic 3+ also provides a simple command-line interface for managing the server, and a web-based interface for monitoring the server.

Mozaic 3+ is also designed to be flexible, so that it can be used in a variety of different environments. For example, Mozaic 3+ can be used in a traditional data center, where servers are mounted in racks and connected to a network. Mozaic 3+ can also be used in a hyperconverged infrastructure, where storage and networking are integrated into the server.

Easy Upgrades

Mozaic 3+ is designed to be easy to upgrade. Mozaic 3+ uses a modular architecture, so that new features can be added without affecting existing functionality. Mozaic 3+ also uses a rolling upgrade process, so that the server can be upgraded without any downtime.

How Does the Platform Work?

Mozaic 3+ is the evolution of Mozaic 3 for modern processors, including AMD EPYC™ 7003 Series processors. Mozaic 3+ is a software platform that enables a server, composed of multiple sockets connected by xGMI, to be split into multiple smaller servers. Each of these smaller servers has its own dedicated CPU sockets, memory, and PCIe devices.

At the heart of Mozaic 3+ is the Mozaic Orchestrator, a user-mode application that runs on the server. The Mozaic Orchestrator is responsible for configuring the xGMI fabric, and for creating and managing the smaller servers.

Putting Back the Control on Mozaic 3+ Tech

Each of the smaller servers is presented to the operating system as a standard, multi-socket server. The operating system does not need to be aware that it is running on a Mozaic 3+ server, and can be installed and configured in the usual way. The Mozaic Orchestrator is responsible for ensuring that the xGMI fabric is configured correctly, and that the smaller servers are isolated from each other.
